

SUCCULENTS

CARE INSTRUCTIONS

Light Requirements: Most succulents thrive in dry, warm climates. Most enjoy sunlight and prefer at least 6 hours of sun per day, so try to place them near a south or east facing window. You may notice your succulents becoming spindly or stretching toward the light if they don't get enough sun.

Watering: Succulents can retain water so be careful not to overwater! It's best to water them thoroughly, saturating the soil but allowing the soil to become almost completely dry before watering again.

Insect Control: Spray with Bonide Eight

Fertilization: Succulent can be fertilized in the spring when new growth would be forming and again in late summer. An all-purpose water-soluble fertilizer diluted to half its strength will do the trick! There is no need to fertilize over the winter as succulents are semi-dormant during this time.
